

Management Practices for Safer Roads: Toolkit

People

| | |
|---------------------------|---|
| Type: | e-Toolkit |
| Location: | Web Based |
| Date: | Free and Open Event |
| Duration of event: | 1 Weeks |
| Programme Area: | Decentralize Cooperation Programme |
| Specific Target Audience: | No |
| Website: | https://unroadsafetylearn.wordpress.com/featured-courses/ |
| Price: | No Fee |
| Event Focal Point Email: | roadsafety@unitar.org |

BACKGROUND

Road traffic injuries claim 1.35 million lives each year with a disproportionate impact on health and development. They are the ninth leading cause of death across all age groups globally and the leading cause among young people aged between 15 and 29 years, costing governments approximately 3% of GDP and 5% in low- and middle-income countries (World Health Organization, WHO 2018).

Achieving road safety targets requires, among others, improving existing road infrastructure for the benefit of all road users, especially the most vulnerable (Decade of Action for Road Safety 2011-2020 – Pillar 2).

Improvements in infrastructure planning, design and construction, including the provision of safe infrastructure for pedestrians and cyclists can reduce the risks that lead to road traffic injuries and fatalities. A lack of basic facilities such as footpaths, cycle paths, crosswalks, motorcycle lanes and safe speed-controlled crossing points on many roads, increases the level of risk for all road users.

According to the World Health Organization, improving the 10% highest-risk roads in each country over 20 years, through the implementation of footpaths, safety barriers, bicycle lanes and paved shoulders, just to mention a few, has the potential to prevent around 3.6 million deaths and 40 million serious injuries (WHO, 2015)

Pillar 2 of the Road Safety Decade of Action highlights that having safer roads requires:

- Identifying the number and location of deaths and injuries by road user type, and the key infrastructure factors that influence risk for each user group
- Identifying hazardous road locations or sections where excessive numbers or severity of crashes occur
- Conducting safety assessments of existing road infrastructure and implement proven engineering treatments to improve safety performance

EVENT OBJECTIVES

In line with the Road Safety Decade of Action, the "Management Practices for Safer Roads Toolkit" overall objective is to serve as a guiding document of concrete measures that improve road safety by providing a methodology that:

- Identifies the number and location of deaths and injuries by road user type, and the key infrastructure factors that influence risk
- Pinpoints hazardous road locations or sections where excessive numbers or severity of crashes occur and take corrective measures accordingly

It is based on the premise that achieving road safety targets requires, among others, improving existing road infrastructure for the benefit of all road users, especially the most vulnerable.

CONTENT AND STRUCTURE

The Toolkit has been designed to be an interactive e-learning tool that can be used by government officials, road engineers, planners and policy makers from the public and private sector.

It presents case studies and best practices from different countries across continents including the Dominican Republic, India, China, and Brazil, thereby highlighting the feasibility of its recommended measures and its application in diverse contexts.

- Module 1: Introduction to the road safety global framework
- Module 2: Management methodology
- Module 3: Application to road safety (Case studies from: Brazil, Dominican Republic, India, Mexico, South Africa)
- Module 4: Multistakeholder approach (China)

TARGETED AUDIENCE

The Toolkit aims to serve government officials, policy makers, engineers, planners and practitioners, road safety professionals and road users in general.
